PROFESSIONAL SUMMARY

Data analyst who owns projects end to end: from a stakeholder's rough question through the SQL, a Tableau dashboard teams trust without re-checking, and a plain-language recommendation they can act on. I ran a pricing and cost engagement for a multi-venue client group solo that surfaced close to A\$2M in savings, presented straight to the Chief Procurement Officer, and I take data accuracy personally. I'd bring that same discipline to Growe as a Middle Data Analyst, applied to revenue, customer and retention metrics, in the fully remote setup I already work in.

KEY SKILLS

Analytics ownership: end-to-end analytical projects (requirements to presentation), business metrics definition, revenue and cost analysis, translating business questions into analysis for non-technical stakeholders, ad hoc analysis

SQL & data modelling: SQL, large datasets (millions of rows), data modelling, reusable analytical datasets, descriptive statistics, trend and anomaly detection

Dashboards & reporting: Tableau (16+ built and maintained), Power BI, automated reporting, KPI monitoring

Data quality: validation logic, discrepancy investigation, data-accuracy monitoring, documentation

Also comfortable with: Python, Git (version control), remote/async client collaboration

EXPERIENCE

Data Analyst, Purchasing Index Data Analytics (Comprara Group) | Jun 2024 to Present | Melbourne, Australia

A data and analytics consultancy serving enterprise clients across Australia and New Zealand. I own each engagement end to end: gathering requirements, building the analysis in SQL and Tableau, and presenting recommendations to senior stakeholders.

Pricing and cost analysis, multi-venue restaurant group (AU/NZ)

- Problem: the client believed they were overspending on supplier costs but had no dataset or visibility into where the money was going.
- Approach: built a product catalogue of roughly 3,000 items from scratch, then a Tableau dashboard in SQL and Python tracking price movement and cost leakage down to product, venue and supplier; ran the account solo, presenting findings in bi-weekly meetings.
- Result: helped the client find close to **A\$2M (about 30%)** in savings in their largest category over a year, presented directly to the Chief Procurement Officer and category managers, and used at the negotiating table.

Data quality and validation, largest client account (5 regions, 13 sub-regions)

- Own the SQL and Python pipeline behind roughly 6M invoice rows (500k to 600k refreshed weekly).
- Built automated validation checks (row counts, data types, column consistency) that catch discrepancies before they reach a report, and standardised how all 13 regions submit data so every dataset is comparable.
- Result: cut weekly processing from 4 to 5 hours to about 75 minutes and removed manual number checking for the firm's largest account.

Dashboards and reusable reporting, procurement and finance teams

- Built and maintain 16+ Tableau dashboards giving procurement and finance stakeholders self-service visibility into spend, KPIs and cost-optimisation opportunities.
- Documented metrics and definitions so the underlying datasets stay reusable as new dashboards get added, cutting repeat manual reporting requests.

Reporting automation, internal (my own firm)

- Built an internal workflow, with a QA check on the output, that auto-generates client progress reports from our analytics outputs; adopted across roughly 25 to 30 accounts, saving about 12 to 15 hours a week firm-wide.

Data Engineer Intern, Victorian Centre for Data Insights (VCDI) | Aug to Nov 2023 | Melbourne, Australia

- Built a distributed anomaly-detection pipeline on government procurement data (Databricks, PySpark) to flag unusual spend patterns, delivered through a Power BI solution adopted by senior Department of Transport stakeholders; lifted detection accuracy by about 20%.

PROJECTS

- **MyFacit (personal SaaS):** a weekly profitability and decision-support product I built for independent cafes. It unifies POS sales, wages and supplier invoices into one revenue and margin view, then runs item-level menu engineering (which dishes actually carry the margin versus which just look popular) and short-term sales forecasting, surfacing the handful of decisions an owner should make that week. Live with a design-partner cafe, it is my closest personal analog to ongoing revenue and performance monitoring: defining the metrics, tracking the trend, and turning it into a plain recommendation.
- **Cloud Data Platform (personal):** SQL-based data modelling and an automated ingestion pipeline into Snowflake, built with Terraform for a reproducible, version-controlled setup.

EDUCATION

Master of Data Science, Monash University (2022 to 2023) | **Bachelor of Engineering**, Thapar University (2017 to 2021)
