Hiring Manager | Data Analyst | UniSuper

Dear Hiring Manager,

I am writing to apply for the Data Analyst role at UniSuper. The job as described, translating business needs into clear requirements, delivering Power BI reporting and dashboards, keeping BAU and ad hoc analysis running to SLA, and lifting BI processes and data literacy across the business, is the exact shape of the work I do today in a data warehouse environment, and it is how I want to keep working: close enough to the data to trust it, and close enough to the stakeholder to know it is actually useful.

The clearest proof of that is a restaurant chain client I have owned as the sole analyst at PI Data Analytics. I structured a product catalog of roughly 3,000 to 3,500 items, built a pricing-decision dashboard tracking price movements and cost leakage down to the product, venue and supplier level, and ran bi-weekly meetings directly with the Chief Financial Officer, Chief Procurement Officer, and category managers, translating the numbers into decisions they could act on. That work identified roughly A\$2M in savings in one spend category, and it is the same cycle UniSuper is hiring for: a business need, a data model built around it, a dashboard that answers it, and a stakeholder who trusts the answer.

I also run the end-to-end pipeline for the largest client account at the firm, spanning five global regions and thirteen sub-regions. I standardised file-submission and naming conventions across every region, built automated validation that catches and logs discrepancies before they reach a dashboard, and documented the process so it runs consistently without me in the room. Alongside that, I have shipped 16+ production Tableau dashboards and a Power BI solution adopted by senior Department of Transport stakeholders, all built on Advanced SQL, Python, and a working comfort with Azure and Databricks. That is the same discipline UniSuper is asking for: improving BI processes, documenting metrics, and building the kind of self-service reporting that raises data literacy rather than routing every question through an analyst.

UniSuper's Enterprise Data Platform and the scale of data behind a fund managing members' retirement outcomes is a direct match for the kind of enterprise-scale, governance-heavy, multi-stakeholder data work I have been doing across procurement and government clients. The domain changes; the discipline of turning large, messy datasets into trustworthy, well-documented reporting for people who are not analysts does not, and I would bring that straight into your team.

Thank you for considering my application. I would welcome the opportunity to discuss the role further.

Sincerely,

Dhruv Nirmal
