Hiring Team, Puffy (Experimentation Analyst, Analytics team)

Dear Hiring Team,

I'm applying for the Experimentation Analyst role on Puffy's Analytics team. What stood out reading the posting is how closely it matches how I already operate day to day: writing my own SQL and Python, connecting to the data myself rather than routing requests through someone else, and turning the analysis into a recommendation on my own timeline. This isn't a stretch for me, it's a continuation of what I already do.

At PI Data Analytics, a data and analytics consulting firm, I independently own analytics engagements for enterprise clients rather than working off tickets someone else scoped. For a multi-venue restaurant group across Australia and New Zealand, I was the sole analyst on the account: I built their product catalog from scratch, then a pricing-decision dashboard tracking price movement down to the product, venue, and supplier level, and presented findings directly to the Chief Procurement Officer and category managers. That work surfaced roughly A\$2M in identifiable savings in their largest spend category over a year, the kind of finding that only shows up when you dig past top-line reporting into segment and driver-level detail.

The technical edge behind that is real. I led the build of a one-vs-all classification pipeline (scikit-learn, TF-IDF, engineered features, cross-validation, explicit class-imbalance handling) that cut a six-week manual categorisation cycle on a roughly A\$12B spend dataset down to about a day, and I separately replaced a manual, error-prone weekly data upload for our highest-billing client with an automated multi-source pipeline I built and validated myself, with no engineering team involved. I've also built and now orchestrate agentic AI/LLM workflows on top of that same SQL and Python foundation, speeding up analytics-script development and automating quality checks before anything reaches a client.

What draws me specifically to Puffy is the shape of the seat: a fast-scaling, high-traffic D2C platform where one analyst's read on a funnel drop-off can move a real business decision quickly, sitting on a team that clearly hires for technical depth rather than dashboard-watching. I've spent two years proving that model on the consulting side, independently, across multiple accounts, with non-technical stakeholders as the audience for every finding, and I'd like to bring that same ownership to Puffy's experimentation program.

I'd welcome the chance to talk through how this experience applies to your funnel and testing priorities. Thank you for your consideration.

Sincerely,

Dhruv Nirmal
