Linktree, Business Analytics Team, Melbourne

Dear Hiring Team,

I'd like to apply for the Data Analyst role on Linktree's Business Analytics team. What drew me to it is the shape of the job: an analyst who owns a question end to end, from framing it with a stakeholder through to the SQL and a recommendation someone actually acts on, rather than handing off a chart and moving on. That's how I already work, and I'd like to point it at a product used by tens of millions of creators.

The clearest example is a restaurant group I ran as the sole analyst, across Australia and New Zealand. They felt their costs were too high but couldn't say where, so there was no brief, just a vague concern. I scoped it into testable questions, built a product catalogue of around 3,000 items, modelled the transaction data in SQL, and shipped a dashboard that drilled from category trend down to the specific product, venue and supplier driving overspend. I ran the relationship directly with the Chief Procurement Officer and category managers, and it helped them find close to 30% savings, roughly A\$2M over a year, in their largest category. That's question to SQL to recommendation, run independently, with a real number at the end.

Underneath that is a solid SQL and Python base. I led a spend-categorisation model over roughly A\$12B of client data that cut a month-long manual cycle to a single day, and I standardised how one client's data is defined across 13 sub-regions so everyone reports against the same numbers. I've also built Facit, a live SaaS that gives independent cafe owners a weekly read on revenue, food cost and margin from messy POS and supplier data. Shipping something a non-technical operator opens every week is the closest I've come to product analytics for a real end user, and it's where I test whether a metric definition actually holds up outside a spreadsheet.

What makes Linktree the right next step is that the work carries straight over: comfortable with ambiguity, fluent in SQL, and used to being the person a stakeholder trusts to turn a question into a decision. I've done that where the stakes were procurement spend and margin; doing it for a creator platform at that scale, where the analysis feeds real product decisions rather than getting filed away, is exactly what I want to do next. I'd welcome the chance to talk.

Best regards,

Dhruv Nirmal
