Hiring Manager, Brighty

Dear Hiring Manager,

I am writing to apply for the Data Analyst role at Brighty. The job as described is close to how I already work day to day: pulling data from several systems, writing SQL to clean and shape it, building dashboards that non-technical teams can act on, and applying statistics to explain what is actually going on underneath a number. I also work remotely now, which means I write things down clearly and give proactive updates so people are not left waiting on me, and I understand the role is remote or hybrid.

The clearest example of that pattern is a pricing and cost engagement I ran for a multi venue restaurant group. I structured a catalogue of around 3,000 products in SQL, then built a dashboard that let the team see where money was leaking, down to the specific product, venue and supplier driving the cost. I presented the findings directly to the CFO and category managers on a recurring basis, and over a year that work helped the client identify close to 30% savings in their largest spend category, close to A\$2M. That is the same shape of work Brighty needs on the product and finance side: a question, the SQL and dashboard behind it, and a recommendation someone actually uses.

Underneath that client work is a solid statistics and modelling base from a Master of Data Science, which I put to use building a classification model over a large spend dataset (TF-IDF features and logistic regression) that cut a month-long manual categorisation process down to a single day's model run. I have also worked with cloud data warehousing directly, provisioning AWS and Snowflake infrastructure as code for a personal project, and I have built and maintained automated checks that catch data-quality issues before they reach a client report, which maps closely to the accuracy and data-tracking requirements the role calls out.

What makes Brighty appealing beyond the mechanics of the role is the product itself: a single app for managing, saving and growing money is a genuinely useful thing to build good data behind, and getting that right in a fast-moving fintech and digital asset space means the analysis has to be accurate and fast, not just interesting. My background is enterprise analytics rather than fintech specifically, but the underlying discipline of querying data carefully and turning it into something a stakeholder trusts and acts on carries over directly. I would welcome the chance to discuss the role further. You can reach me at dhruvnirmal2111@gmail.com or +61 406 259 619.

Yours sincerely,

Dhruv Nirmal
