Hiring Team, Quantum | Data Scientist, Transformation AI (Quantum Telstra)

I am writing about the Data Scientist role on the Transformation AI team within Quantum Telstra. Building models and AI capabilities that run inside a partner's live operational systems, and turning those outputs into something a non-technical stakeholder can act on, is exactly how I already work as a data scientist at a consulting firm: I own a problem from framing through to a model, or an agent, running in production, and I sit with the people who use the output until it makes sense to them.

The proof I am proudest of is an agentic workflow I built to generate our clients' progress reports. Rather than trust a single AI pass, I added a second, independent verification agent, one with no memory of the drafting session, that re-derives the key numbers from the source data and checks them against the draft before a human reviews and sends it. It is now used across the whole analyst team, saving roughly 12 to 15 hours a week, and it reflects how I think AI should earn its place in a production system: useful, but checked. Alongside that I led the firm's first machine-learning classifier to categorise a client's five-year, roughly A\$12B spend book, a one-vs-all logistic regression model with engineered text and value features that cut a categorisation cycle from over a month to a single day, and I ran the pricing analysis for a restaurant chain across Australia and New Zealand that helped them find close to A\$2M in savings, presenting the findings directly to their Chief Procurement Officer.

Underneath both of those is a genuine technical base: Python, SQL and scikit-learn for the predictive side, Prophet for forecasting with external drivers like freight cost trends, and Claude and structured agent design for the AI side. I also built a personal multi-agent system, an orchestrator that delegates to specialist agents for different tasks, purely to keep that agentic muscle sharp outside of client work. I am comfortable with a working understanding of things like gradient boosting or retrieval-augmented generation being the starting point rather than the finish line, and genuinely enjoy the part of the job where you go from "I've read about this" to "I've shipped it."

What draws me to Quantum specifically is the shape of the problem: real predictive models and real AI, built by the same team, feeding decisions that show up in a business the size of Telstra rather than staying in a slide deck. That mix, model and agent, data science and applied AI, stakeholder trust and technical depth, is the combination I have spent the last two years building toward, and I would welcome the chance to bring it to the Transformation AI team.

Regards,

Dhruv Nirmal
