Hiring Team, Saela

Dear Hiring Team,

I am writing to apply for the Data Analyst/Engineer role at Saela. Being handed a product with no warehouse or BI layer yet and asked to decide what it needs, then build it, is close to how I already like to work: SQL first, query by query, then Python for anything that has to run on a schedule or scale past a single query. In my current role I already own that kind of ambiguity day to day, deciding how a dataset or a delivery pipeline should be built rather than working off a fixed spec, and taking that same ownership over how a product measures itself, end to end, is exactly the kind of high-ambiguity, high-initiative work I do best.

The clearest example of that pattern is a pricing and cost engagement I ran for a multi-venue restaurant group. I structured a catalogue of around 3,000 products in SQL, segmented spend by product, venue and supplier to isolate exactly where cost was leaking, and built a dashboard the client's team used to track it. Presenting that analysis directly to the Chief Procurement Officer and category managers, on a recurring basis, helped the client identify close to A\$2M in savings in their largest spend category over a year. That is the same shape of work Saela needs on the product side: a real question, the SQL and validation behind it, and a number a stakeholder actually trusts and acts on.

Underneath that client work is a genuine technical edge I would bring on day one: I have provisioned a cloud data warehouse from scratch on Snowflake, as infrastructure as code in Terraform, with automated ingestion running on top of it, so I have already made and executed the call on what comes after a single database stops being enough. I also design and manage agentic AI workflows in production, including an independent verification agent that re-derives and checks numbers before anything reaches a client. That is precisely the "leverage agents, do not replace the judgment behind the work" approach Saela is looking for, not a theoretical interest but something I run daily.

What makes Saela a genuine fit beyond the mechanics of the role is that I already know what it means to own a product's numbers, not just build a dashboard for one. I designed and run MyFacit, a live profitability product for independent cafes, where I decide what gets measured and why, and a design-partner cafe uses it every week. Pairing that instinct for defining the metrics that matter with a health-privacy product that wants everything kept internal and secure feels like a direct fit for the discipline I already apply to data validation and integrity, not something I would need to learn from scratch. I would welcome the chance to discuss the role further. You can reach me at dhruvnirmal2111@gmail.com or +61 406 259 619.

Yours sincerely,

Dhruv Nirmal
