Hiring Team, StellarTech

Dear Hiring Team,

I am writing to apply for the Senior Data Analyst, LTV and Predictive Analytics role at StellarTech. What draws me to it is the shape of the work itself: owning a live prediction model, watching it against real outcomes, and digging into what actually moves the number rather than just reporting it. That is exactly how I like to work, and it is what I have spent the last two years doing on procurement and forecasting problems for enterprise clients.

The clearest proof of this is a demand-forecasting engagement I built for a fresh produce and agricultural client. They needed a rolling three-month view of raw material and chemical inventory, including items sourced internationally and exposed to freight-cost swings. I built a Prophet time-series model, engineered external regressor features for sea-freight trends and input pricing, prototyped the underlying logic in SQL, and backtested it against actual usage on held-out periods before it went into a planning dashboard. The forecast held within a 12.5 to 14% error margin against actuals, comfortably inside the client's tolerance, and the client used it directly to plan ordering. That cycle, build a forecast, validate it against reality, and explain where it holds and where it does not, is the same discipline this role asks for in owning and evolving the LTV algorithm.

Alongside the forecasting work, I led the company's first machine-learning classifier over roughly A\$12B of client spend, a one-vs-all logistic regression built in scikit-learn with engineered features on top of TF-IDF and embeddings text signals, tuned via GridSearchCV and cross-validation, and evaluated on precision, recall and F1 to account for a heavy class imbalance. That project is where I built the muscle for factor analysis: working out which features actually distinguish one category from another, not just fitting a model that scores well. I also design and own MyFacit, a live profitability product for independent cafes, where I define the unit economics it tracks, revenue, cost and margin, and turn a weekly number into the one decision the owner should act on next. It is the closest thing I have to owning a metric end to end for a subscription-style product, and it means I already think in terms of forecast accuracy, cost drivers and payback rather than one-off reporting.

StellarTech's B2C subscription apps and its emphasis on building AI into the analytics itself are exactly the kind of environment I want to keep working in: model-driven decisions at scale, not dashboards for their own sake. The discipline I bring, validating a forecast against a closed cohort of outcomes, isolating which factors move a business metric, and turning that into a recommendation Product, UA and Finance can act on, is the same discipline behind owning an LTV model, and I would bring it straight to your subscriber base. I would welcome the chance to help build the automated, model-quality monitoring this role is set up to own.

Thank you for your consideration. I would be glad to discuss the role further at your convenience.

Regards,

Dhruv Nirmal
