Hiring Team, Global Power Components

Dear Hiring Team,

I'm writing about the Inventory Control Analyst role. The core of what you're describing, monitoring inventory accuracy, identifying discrepancies, and closing the data gaps that undermine system integrity, is the work I already spend my time on. At PI Data Analytics I build the reporting and validation that keeps transactional and inventory records trustworthy for enterprise clients, and I'd like to bring that same discipline to a growing manufacturer that's actively building out its inventory system.

The most direct example is the inventory reporting I've built for clients. For one, I built an automated report that refreshes every morning and is now one of the tools the team relies on daily to manage stock, with par-level alerts that flag any item below a threshold they set themselves, so they reorder before a stockout rather than discovering the gap after the fact. I built a weekly-refresh version for another client, and a bill of materials for a fresh-produce client that maps finished products to the raw materials they consume, which is the kind of manufacturing-stock logic this role touches. Alongside that, I built a Prophet model that forecasts raw-material and chemical inventory around three months ahead, giving the client a reliable planning window.

The other half of my day is data integrity at scale. On our largest client account I manage automated validation across a platform spanning 13 regions and roughly 6 million invoice rows: it flags discrepancies, drops stray columns, standardises intake so every source feeds one consistent format, and I work directly with the client's IT teams to fix data gaps at the source rather than downstream. I also reconcile spend and pricing to the product and supplier level to trace variances back to root cause. That mix of reconciliation, standardisation, and system-team liaison maps closely to how you've framed this role, and my Master of Data Science included Supply Chain Management and Applied Forecasting.

I haven't worked hands-on in a specific ERP like Epicor or SAP, but my daily work is already on enterprise invoice, PO, and spend data with validation and reconciliation built in, so that's a fast ramp rather than new ground. I'd welcome the chance to talk through how I can help keep your inventory data accurate as you bring new manufacturing stock into the system.

Thank you for your time and consideration.

Kind regards,

Dhruv Nirmal
