Electronic Arts, Publishing Insights and Markets, Asia Publishing

Dear Hiring Team,

I'm applying for the Data Scientist role with EA's Publishing Insights and Markets team in Asia Publishing. The job description reads like a description of how I already work: building and maintaining statistical and ML models, testing them properly, and then documenting and automating them so the results keep reaching the business long after the first build. That combination of practical modelling paired with real rigor around validation and maintenance is exactly the kind of work I look for.

The clearest example is a multi-country restaurant chain account across Australia and New Zealand that I owned end to end as the sole analyst. I built the product catalog that underpinned everything, then a pricing-decision dashboard that tracks price movement down to the product, venue and supplier level so the client could see exactly where they were losing money on bad deals. I ran that relationship directly, presenting findings in bi-weekly and monthly sessions to the Chief Procurement Officer and category managers, and the work helped the client find close to 30% savings in one of their largest spend categories over the year.

On the modelling side, I built a Prophet-based forecasting model for a fresh-produce client to plan raw-material and chemical inventory three months ahead, folding in external drivers such as sea-freight trends, and landed it within a 12.5 to 14% error margin, comfortably inside the client's tolerance. I've also led a one-vs-all classification model to categorise a client's roughly A\$12B, five-year spend dataset, doing the feature engineering, hyperparameter tuning, class-imbalance handling and cross-validation myself, and turning a categorisation cycle that used to take an account manager over a month into a single day's model run. And when I noticed our own client-reporting process was manual and repetitive, I built an agentic workflow that automates report generation straight from our analytics outputs, which the whole analyst team now uses across roughly 25 to 30 accounts.

What draws me to EA is the chance to apply that same practical, build-and-maintain approach to markets and player behaviour instead of procurement and supply chains. I've built models across genuinely different commercial settings, from industrial supply chains to government transport data, and each time the job has come down to the same thing: understand the data, build something statistically sound, and make sure the business can actually use it. Getting to do that for games people actually play, across Asia's priority markets, is a genuinely exciting shift for me, and I'd bring the same documentation-first, automation-minded habits that keep my current models running long after I've moved on to the next one.

I'd welcome the chance to talk about how I could contribute to the team. Thank you for your time and consideration.

Kind regards,

Dhruv Nirmal
