Hiring Team, Hack The Box

The Data Analyst role on HTB's Federal Sales team is a close fit for how I work. My day job is translating messy enterprise data into ROI stories for senior executives, running the full client relationship from scoping an ambiguous problem through to presenting findings to the C-suite. I do this across five accounts simultaneously as the sole analyst on each, which is the same shape of work the role describes: a dedicated analytical partner to a set of high-stakes client relationships, where the output is a coherent story about what the data means for the mission.

The clearest proof is an account I ran for a restaurant chain across Australia and New Zealand. The client had a vague sense they were overpaying suppliers but no structured way to see where or by how much. I built a pricing-decision and cost-leakage analytics platform from scratch, ran the bi-weekly progress meetings with the CFO and Chief Procurement Officer, and surfaced roughly A\$2M a year in savings concentrated in a single procurement category. That account illustrates the exact work pattern HTB is describing for Federal agency clients: take a complex, multi-source dataset, extract the signal, and put it in front of executives in a form they can act on.

On the technical side, I work in Python and SQL daily and have built a layer of AI-assisted tooling into the analytics process. A call-transcript analyser I built for an internal hackathon scored 1st place and was later adopted into the company workflow. It ingests sales call transcripts, scores each engagement across call quality, sentiment, and expectation alignment, and routes the findings to the right internal stakeholders automatically. That is functionally identical to the behavioral and engagement-signal analysis HTB needs for training telemetry: scoring how users engage, flagging patterns, and surfacing them to the people who need to act. I have also built a multi-agent data QA pipeline and a company-wide report-generation workflow that now saves 12-15 hours per week across ~30 client accounts.

HTB is one of the few organisations doing something genuinely new in cybersecurity workforce development, and the Federal Sales team sits at the sharpest edge of that mission: proving measurable readiness impact to the USG stakeholders who fund it. What I bring is a proven pattern of doing exactly that for enterprise clients, and AI-building capability that accelerates the analytical work underneath. The methods transfer directly. I would welcome the chance to discuss how.

Thank you for your time.
