Hiring Team, Global Power Components

Dear Hiring Team,

I'm writing to apply for the Inventory Control Analyst role at Global Power Components. Most of my day to day already lives in exactly the problem you're describing: monitoring transactional data for accuracy, chasing down why a discrepancy exists, and standardising how data enters a system so it stops recurring. My Master of Data Science at Monash also included coursework in Supply Chain Management and Applied Forecasting, so the domain isn't new territory for me, it's close to where I already spend my time.

The clearest proof of that is the largest client account I run at Purchasing Index Data Analytics, a spend-analytics platform spanning 13 regions and roughly 6 million invoice rows a week. I built the automated validation layer that flags discrepancies, drops stray or malformed columns, and standardised file submission so every region feeds one consistent process instead of 13 different ones. I liaise directly with the client's IT and system teams to trace issues back to the source and fix them there rather than patching them downstream, which is the same relationship this role is asking me to build with your ERP/MRP teams.

On the inventory side specifically, I built a time-series forecasting model for a manufacturing-adjacent client that projects raw-material and chemical inventory levels around three months out, landing within a 12.5 to 14% error margin against their accepted tolerance. I've also led a project reconciling a five-year, roughly A\$12B spend dataset that had been unreliably categorised, pairing a rules-based approach with a machine-learning model and manual review of the highest-value exceptions to cut a month-long cycle down to about a day. Advanced Excel, SQL Server, Power BI and Tableau are daily tools for me, not add-ons.

What draws me to Global Power Components specifically is the moment you're in: bringing new inventory, including manufacturing stock, into your system and needing someone to hold the data integrity steady while that happens. That's a data-integrity problem before it's a manufacturing problem, and it's the kind of ambiguous, cross-team problem I've been solving for enterprise clients for two years. Being fully remote also matches how I already work: I keep clear written documentation and proactive updates so distributed teams and clients stay aligned without needing to be in the same room, which matters more, not less, on a remote team.

I'd welcome the chance to talk through how this experience maps to your inventory and system-integrity goals. Thank you for considering my application.

Sincerely,

Dhruv Nirmal
